                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            complex.
SUBCELLULAR LOCATION: CYTOPLASMIC. ASSOCIATED WITH INTRACELLULAR MEMBRANES. PROBABLY PRESENT ON VESICLES OPERATIONAL BETWEEN THE ER AND THE GOLGI COMPLEX.
DOMAIN: The rodlike tail sequence is highly repetitive, composed of an heptapeptide repeat pattern characteristic of alpha-helical coiled coils. May form filamentous structures in the cell.
SIMILARITY: BELONGS TO THE VDP/USOI/YBL047C FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "A cytoskeleton-related gene, usol, is required for intracellular protein transport in Saccharomyces cerevisiae."; J. Cell Biol. 113:245-260(1991).

Subunit: Myosin is a hexameric protein that consists of 2 heavy chain subunits (MHC), 2 alkali light chain subunits (MLC) and 2 regulatory light chain subunits (MLC-2).

DOWAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.

SIMILARITY: Contains I myosin-like globular head domain.

artery, bladder, esophagus and trachea.
DOAAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.
                                                                                                                DISEASE: A chromosomal rearrangement, known as pericentric inversion Inv(16) (p13,q22), Produces a fusion protein that consists of the 165 N-terminal residues of CBF-beta (PEPB2) with the tail region of MHALL. This rearrangement is associated with acute myeloid leukemia of MHEO subtype.

MISCELLARBOUS: Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conservative 168; Mismatches 301; Indels 166; Gaps

-!- DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.
-!- SIMILARITY: Contains 1 myosin-like globular head domain.

-!- FUNCTION: Muscle contraction.
-!- SUBUNIT: Muscle contraction.
-!- SUBUNIT: Muscle contraction.
-!- SUBUNIT: Muscle contraction.
-!- SUBUNIT: Muscle contraction.
-!- SUBUNIT: Muscle myosin is a hexameric protein that consists of 2 and 2 regulatory light chain subunits (MLC-2).
-!- SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
-!- SUBCELLULAR LOCATION: Thick filaments of the myofibrils.
-!- DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.
-!- MISCELLANBOUS: Each myosin heavy chain can be split into 1 light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    X-RAY CRYSTALLOGRAPHY (3.5 ANGSTROMS) OF 1-818, AND REVISIONS 204-215.

Binds STX6. Binds RAB5A, RAB5B, RAB5C and RAB22A that have been activated by GTP-binding.
-!- SUBCELDULAR LOCATION: Cytoplasmic and peripheral membrane protein associated with early endosmes.
-!- DOMAIN: The FYVE-type in consones and the phosphatidylinositol 3-phosphate.
-!- DISEASE: Antibodies against EEA1 are found in sera from patients
                                                                                                                          MUTAGENESIS OF ASF-1352; ASN-1357; 1367-VAL-THR-1368; ARG-1375 AND ARG-1400, HOMODIMERIZATION, AND INTERACTION WITH PHOSPHATIDYLINOSITOL

4. FUNCTION: Muscle myosin is a hexameric protein that consists of 2 heavy chain subunits (MHC), 2 alkali light chain subunits (MLC).

5. And 2 regulatory light chain subunits (MLC).

5. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

6. I- DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.

6. CHANGELLANGOUS: Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped

                                 The present sequence represents rat L-FILIP which is a filamin-interacting protein. L-FILIP has a function of controlling cell migration and cell death. L-FILIP has a function not controlling cell migration immunosuppressive activities. The L-FILIP protein can be used for controlling cell migration and cell death, which is applicable in developing drugs for treating or suppressing cancer or tumour metastasis or as regulators of cell migration for transplantation therapy, and also for controlling the mobility and cell death of inerve cells, promoting protein in the treatment of preiventrilcular nodular heterotopia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAAI871394). The polyprocessant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system—such as Deribheral nervous system—such as Deribheral nervous system—such as Deribheral nervous system—such as Deribheral nervous system—such as Deribheral nervous system—such as Deribheral nervous system diseases, Buch as localised neuropathies and Central nervous system diseases, Buch as Alzhelmer F. Perrinnon's disease. Huntingcon a Grasser and Central as Alzhelmer and central nervous system suppression, attain of the activities such as Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer disgnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S. disorders. XX Proteins controlling cell migration and cell death and their encoded Pr DNAs, applicable in developing drugs for treating or suppressing cancer Pr or tumor metastasis or as regulators of cell migration for Pr transplantation.		CC interacting protein. L-FiliP has a function of controlling cell migration can death. L-FiliP has cytostatic, neuroprotective and cell migration act immunosuppressive activities. The L-FiliP protein can be used for CC controlling cell migration and cell death, which is applicable in		XX SQ Sequence 1213 AA;	Pred.                                                                                                                                                                                                                                                                                   8 &
                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes primer sets for synthesising 5602 full-

CC length cDNAs defined in the specification. Where a primer set comprises:

CC an oligo-dT primer and an oligomucleotide comprimentary to the complementary strand of a polynucleotide which comprises one of the 5602 culleotide sequences defined in the specification, where the oligomucleotide comprises at least 15 nucleotides; or (b) a combination of an oligomucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligomucleotide comprising a sequence complementary to the oplynucleotide which comprises a 3'-end sequence, where the oligomucleotide which comprises a 3'-end sequence, where the oligomucleotide which comprises a 3'-end sequence, where the oligomucleotide sequence 3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers sets can be used in antisense therapy and in generication and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the ANH13613 to ANH18613 to ANH18613 to ANH18613 to ANH18613 to ANH18613 to Papersent human amino acid sequences; and ANH1862 to ANH1362 represent coligomucleotides, all of which are used in the exemplification of the protein of the protein of the protein of the protein of the protein of the protein of the coligomucleotides, all of which are used in the exemplification of the protein of the coligomucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AGCGAAGAAGAAAGGTCCTGTGAACTGAGCTGCAGTGTAGACTTACTAAAGAAGCGGCTT 1871

The present invention describes primer sets for synthesising 5602 full-

[a] an Oligo-dr primer and an oligonucleotide complementary to the

[c] an oligo-dr primer and an oligonucleotide complementary to the

[c] complementary strand of a polynucleotide which comprises one of the 5602

[c] connoid-sotide comprises at least 15 nucleotides; or (b) a combination

[c] connoid-sotide comprises at least 15 nucleotides; or (b) a combination

[c] connoid-sotide comprises a sequence complementary to the

[c] conplementary strand of a polynucleotide which comprises a 5'-end

[c] conplementary strand of a polynucleotide which comprises a 5'-end

[c] conplementary strand of a polynucleotide which complementary to a

[c] conplementary strand of a polynucleotide which complementary to a

[c] conplementary strand of a polynucleotide which complementary to a

[c] conplementary strand of a polynucleotide which complementary to a

[c] conplementary strand of a polynucleotide on the complementary to a

[c] conplementary strand of a polynucleotide on the complementary to a

[c] conplementary strand of a polynucleotide on the complementary to a

[c] conplementary strand of a polynucleotide on the complementary to a

[c] conplementary strand of a polynucleotide on the complementary to a

[c] conplementary strand of the abnormality of the proteins encoded by

[c] contain and confident on the primers are also useful for the full-length

[c] contains easily without any specialised methods. AAH03165 to AAH13628 represent

[c] contains and add sequences, and AAH13632 to AAH13632 represent

[c] contains and cold sequences and the exemplification of the

[c] contains and cold sequences and the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CGGCAACTTCGACTCAAACTGGTTGGCTTATCGCAAAGGATTGAGGAGCTGGAAGAGACC 1115

The present sequence is the protein sequence of GIP130b, a novel 130 kDa Goodpasture antigen binding protein (GPBP) interacting protein. The DOC/GIP90/130 mRNA family results from a complex diversification mechanism operating on the expression of the GIP90 gene on chromosome 3 (3q12). GIP90/130 polypeptides of the invention interact with GPBP and are capable of aggregation. They can be used to modify GPBP-GIP90/130 interactions, to modify GP90/130 aggregation, and to modify GPBP-GIP90/130 interactions, to modify GP90/130 aggregation, and to modulate gene expression. The invention provides GIP90/130 polypeptides, portions of them, antibodies, nucleic acid sequences, expression vectors and host cells, as well as methods for detecting GIP90/130 polypeptides and nucleic acids, and methods for treating an autoimmune disease or cancer by modifying the expression or activity of one or more GIP90/130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Goodpasture antigen binding protein-interacting 90 and 130 kDa polypeptides, useful for diagnosing and/or treating disorders associated with the GIP90/130 polypeptide, such as autoimmune disorders and/or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                Goodpasture antigen binding protein interacting protein; GPBP; GIP130b; human; transcription factor; autoimmune disease; cancer; immunosuppressive; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the protein sequence of GIP130c, a novel 130 kDa Goodpasture antigen binding protein (GPBP) interacting protein. The DDC/GIP190/130 mRNA family results from a complex diversification mechanism operating on the expression of the GIP90 gene on chromosome 3 (3q12). GIP90/130 polypeptides of the invention interact with GPBP and are capable of aggregation. They can be used to modify GPBP-GIP90/130 interactions, to modify GP90/130 aggregation, and to modulate gene expression. The invention provides GIP90/130 polypeptides, portions of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Goodpasture antigen binding protein-interacting 90 and 130 kDa polypeptides, useful for diagnosing and/or treating disorders associated with the GIP90/130 polypeptide, such as autoimmune disorders and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Goodpasture antigen binding protein interacting protein; GPBP; GIP130c; human; transcription factor; autoimmune disease; cancer; immunosuppressive; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        629
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the protein sequence of GIP130a, a novel 130 kDa Goodpasture antigen binding protein (GPBP) interacting protein. GIP130a cDNA was isolated from a skeletal muscle cDNA library. It represents an mRNA species that results from faithful transcription and translation of GIP90 genomic DNA. GIP90/130 polypeptides interact with GPBP and are GIP90 genomic DNA. GIP90/130 polypeptides interact with GPBP and are interactions, to modify GP90/130 agregation, and to modulate gene expression. The invention provides GIP90/130 polypeptides, portions of them, antibodies, nucleic acid sequences, expression vectors and host cells, as well as methods for tecting GIP90/130 polypeptides and nucleic acids, and methods for treating an autoimmune disease or cancer by modifying the expression or activity of one or more GIP90/130

```
The invention relates to an isolated polypeptide associated with cell growth, differentiation and death (CGDD). Also disclosed are the polyperides encoding the polypeptides. The polypeptides and polymucleotides are useful in disquestive. The polypeptides and preventing diseases or conditions associated with the decreased expression or expression of CGDD. Such diseases include cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatcry (e.g. AIDS, allergies) and reproductive disorders, or disorders of the placenta. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of CGDD. The CGDD or its fragments are useful in screening compounds for effectiveness as an of nucleic and amino acid sequences of CGDD. The CGDD or its fragments are useful in screening compounds that specifically bind to or modulate the activity of the polypeptide. Microarrays consisting polymucleotides of the invention are useful in monitoring or measuring expression profiles. Sequences given in records AAR69667 represent CGDD polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  996 AGGITITCCCAGGAGCACGAAGAGATGAACGCCAAATTGGCGAATCAAGAATCTCACAAC 1055
